

LoPiX: LOGIC PROGRAMMING IN XML

Databases & Information Systems Group · Institut für Informatik · Universität Freiburg · Germany
http://www.informatik.uni-freiburg.de/~may/lopix · contact: may@informatik.uni-freiburg.de

PROJECT OVERVIEW

- Experiences with F-Logic/FloRID in integration of semistructured data [Flo98, Flo99]

Goals

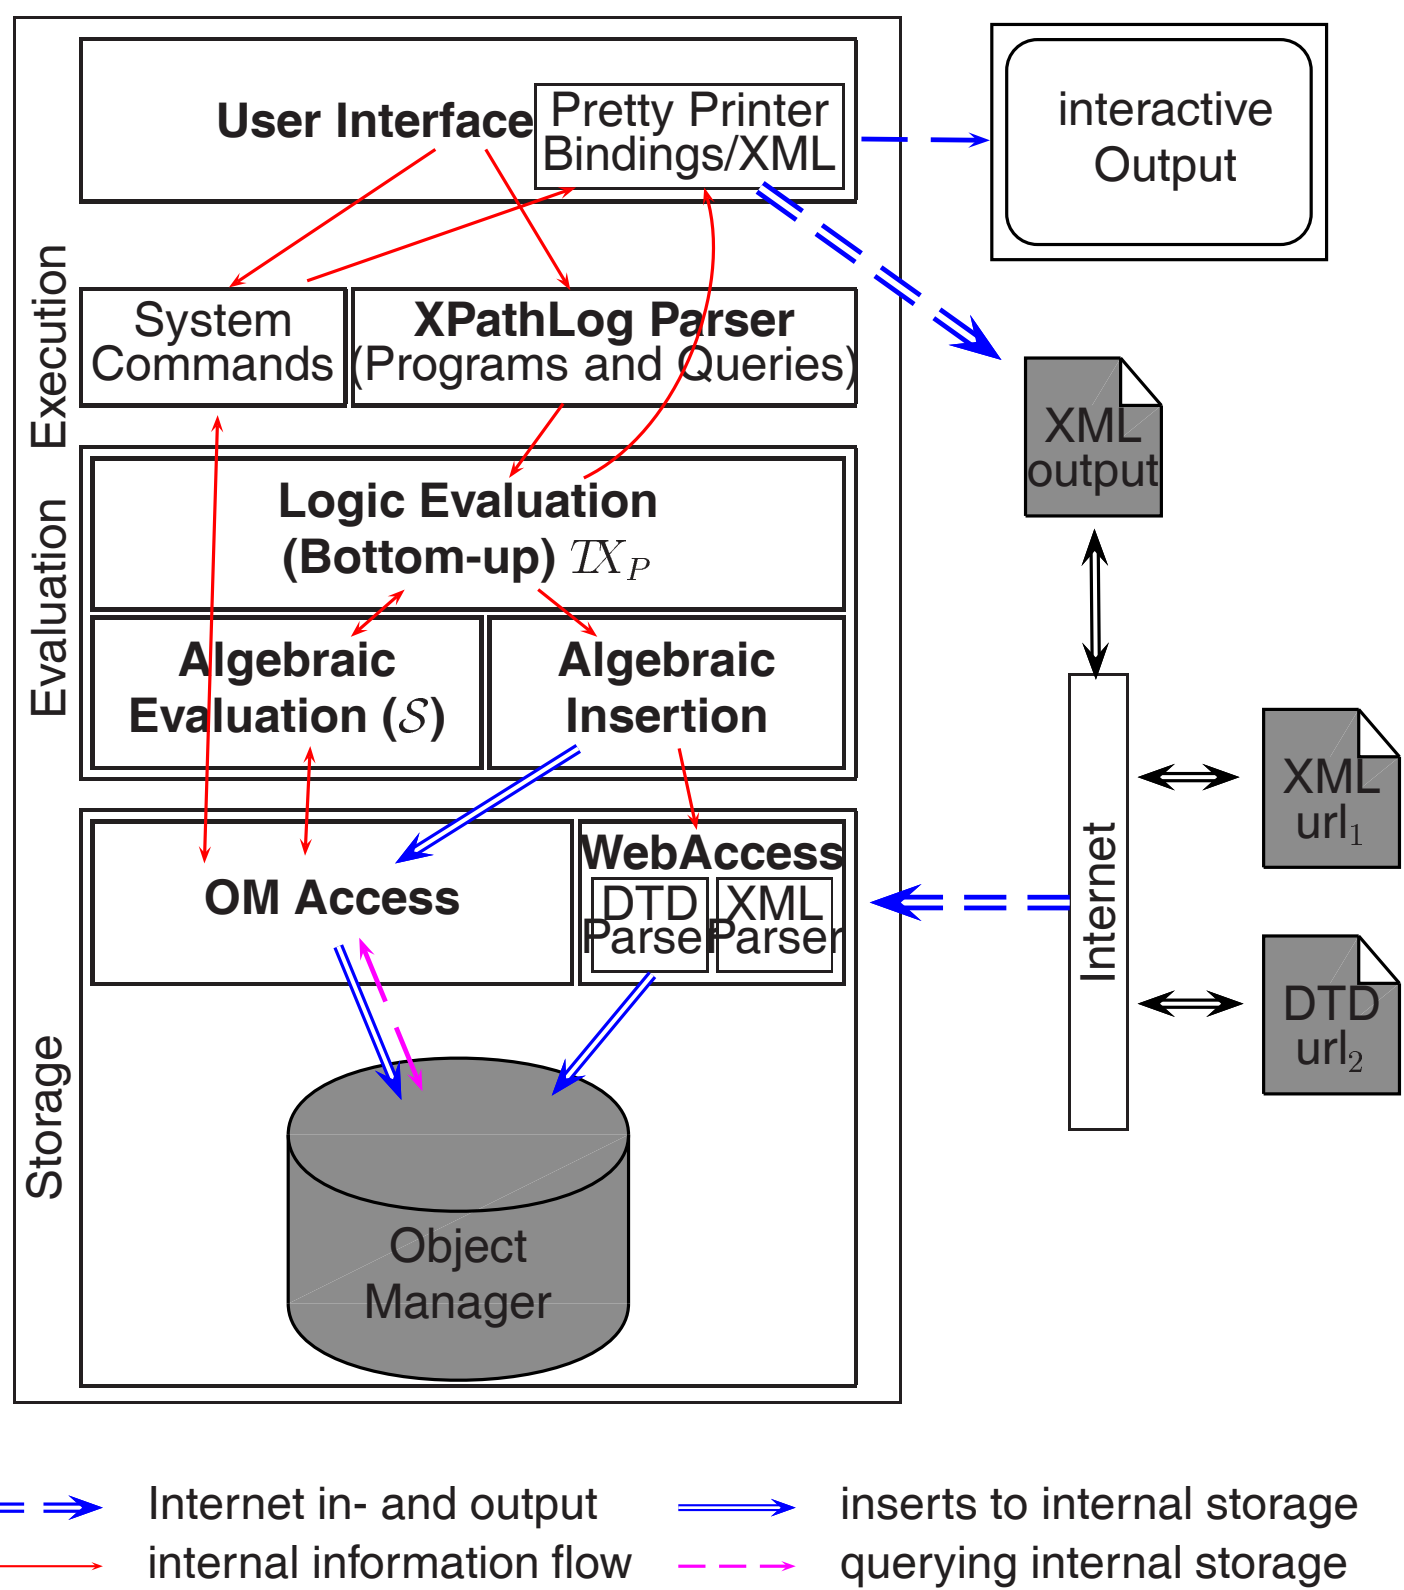

- design & implement a programming language for XML: querying, manipulation, *integration*

Results

- analysis of XML, its languages, and data model(s)
- design own framework ...
- ... end up with a non-W3C data model and using basic W3C language elements:
 - extend XPath
- XPathLog: declarative rule-based language with bottom-up semantics
- XTreeGraph: graph model, overlapping trees, multiple parents, tailored to XML Data Integration
- Implementation: LoPiX
- Case Study: MONDIAL[Mon01]
- The complete report: [Lop01a]

SYSTEM ARCHITECTURE

- object-oriented modular design
- exchangeable storage components

HISTORY

- since 1988: F-Logic, an early "semistructured" data model with a declarative rule-based language (Kifer, Lausen SIGMOD'89 and Kifer, Lausen, Wu JACM'95)
- 1992-1996: Design and implementation of the research prototype FLORID 1.0; language extensions and optimizations.
- 1997-1999: research on mapping HTML data to F-Logic, FLORID2.0 as a Web-enabled version; Data integration from the Web [Flo98, Flo99]
- 1999/2000: application to XML data (FLORID 3.0/FloXML)
- 2000/2001: migration to "native" XML, design of XPathLog, implementation of LoPiX based on FLORID3.0. LoPiX still provides features known from F-Logic such as class hierarchy, signatures, and non-monotonic inheritance as extensions to XML data.

Thanks to E. Behrends, J. Frohn, R. Himmeröder, P.-Th. Kandzia, G. Lausen, B. Ludäscher, D. Malheiro, P. J. Marrón, T. Pterdekämper, C. Schlepphorst, M. Seilnacht, H. Uphoff, and T. Westmann.

LANGUAGE: XPATHLOG

for details see [XPL01a]

- Extends the XPath syntax with *variable Bindings*
- Declarative, rule-based language with bottom-up semantics
 $\text{head}(V_1, \dots, V_n) :- \text{body}(V_1, \dots, V_n)$
- Queries: extends the semantics for XPath given by P.Wadler (1999)
- Constructive semantics for XPathLog atoms in rule heads

XPath-Logic *reference expressions* are XPath *location paths*

```
[0] ReferenceExpr ::= AbsLocPath | ConstLocPath
[2b] ConstLocPath ::= constant "/" RelLocPath
                        | variable "/" RelLocPath
```

Extend LocationSteps

```
[4] Step ::= AxisSpec NodeTest Pred*
           | AxisSpec NodeTest Pred* "-"> Var Pred*
           | AxisSpec Var Pred*
           | AxisSpec Var Pred* "-"> Var Pred*
```

- navigation by dereferencing IDREF attributes
- Predicates over reference expressions

Rule Heads: definite XPathLog atoms

- use only the child and sibling axes
- no negation, disjunction, function applications, and *proximity position predicates*

XPATHLOG: EXAMPLES

Pure XPath expressions

```
?- //country[name/text() = "Belgium"]/city[name/text()].
```

Output Result Set

```
?- //country[name/text() = "Belgium"]/city[name/text() -> N.
N/"Brussels"
:
```

Additional Variables

```
?- //country[name/text() -> N1 and @car.code -> C]/city[name/text() -> N2.
N2/"Brussels" C/"B" N1/"Belgium"
:
```

Local Variables

```
?- //country[name/text() -> N1]/city[population/text() -> P] /name/text() -> N2,
P > 100000.
```

Dereferencing

```
?- //organization[@seat = members/@country/@capital]
   /@seat/name/text() -> N.
```

Navigation Variables

```
?- //Type -> X[name/text() -> "Monaco"].
Type/country X/country-monaco
Type/city X/city-monaco
```

Schema Querying

```
?- //city/N.
N/name
N/population
:
```

XML INFORMATION INTEGRATION

for details see [XPL01c, XPL01d]

- integration of databases: semantics-driven integration process
- objects of different sources represent the same real-world object
⇒ Fusing objects, merging their properties
- synonyms, ontologies
- not compatible with XML Data Models (DOM, XML Query Data Model)

DATA MODEL: XTREEGRAPH

for details see [XPL01b]

- Graph data model, *extends* DOM/XML Query Data Model
- Supports *updates*
- Tailored to *data integration*
⇒ *multiple, overlapping trees*

THREE-LEVEL INTEGRATION

- multiple sources which provide tree structures (basic layer)
- merge data from different sources; "internal" layer: XTreeGraph
 - fuse elements/merge subtrees ~> overlapping trees
 - add subelement links ~> overlapping trees
 - define synonyms for properties
- "export" layer: define *result tree views* by projections

CASE-STUDY IN DATA INTEGRATION: MONDIAL

CIA World Factbook Organizations

- organizations
- memberships

```
<ELEMENT orgs (organization*)>
<ELEMENT organization
  (member_names*)>
<!ATTLIST organization

orgs:established = established.

$$\text{result}[\text{continent} \rightarrow C] :- \text{gs}/\text{gs}:\text{continent} \rightarrow C.$$

Organizations from CIA

resultorganization $\Rightarrow \Omega$

Fusing CIA and GS Countries

```
result[country→C1] C1 = C2 :-
```

```
cia/cia:country→C1[@cia:name→N],
```

$$\text{gs/gs:country} \rightarrow \text{C2}[\text{gs:name/gs:text()} \rightarrow \text{N}].$$

$C[@name \rightarrow N] :- \text{result/country} \rightarrow C / @cia: name \rightarrow N.$

Organization seats

O[@seat→Cty] :-

result/organization→O[@orgs:seatcity→N and
@orgs:seatcountry→CNI

$$\text{result/city} \rightarrow \text{Cty}[\text{@name} \rightarrow \text{N and}$$

@country/@name→CN].

Organization Memberships

O/members[@type→T and @country→C] :-

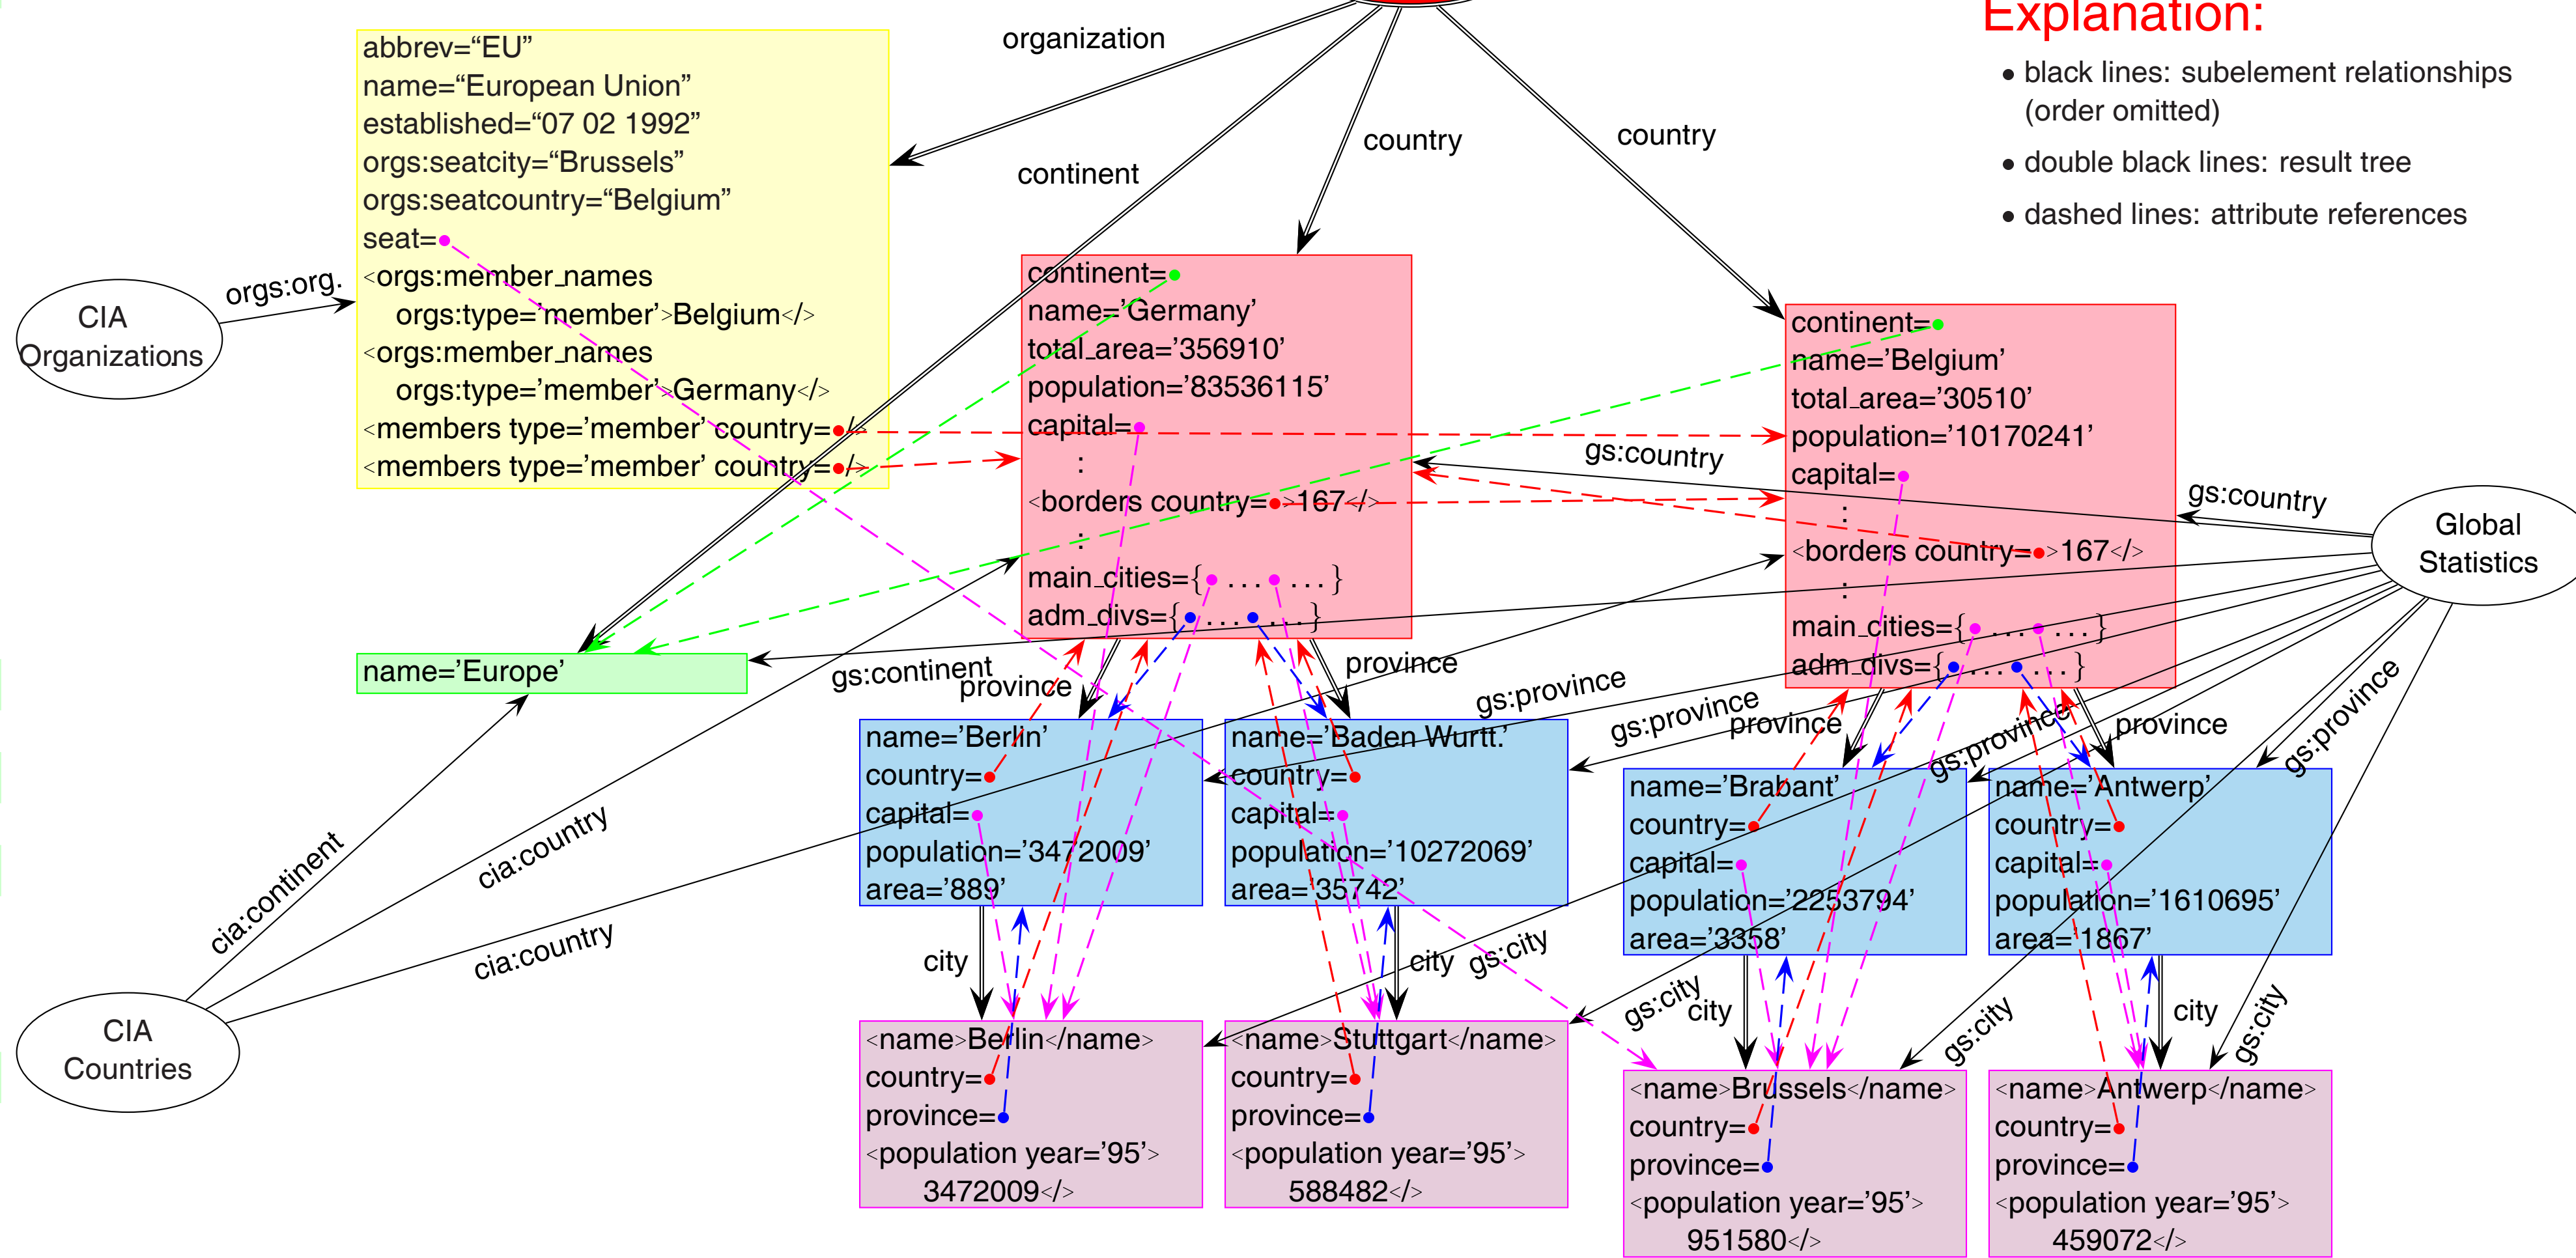

result/organization→O

```
/orgs:member_names[@orgs:type→T]
```

```

/orgs:text()→CN,
result/country→C[@name→C:N]

```

CONTINUING THE INTEGRATION

Subsequent steps integrate the auxiliary country information, adding the car code and german names of the countries. Both are then used for integrating the TERRA data source which uses german names. The full program and the resulting XML file can be found at <http://www.informatik.uni-freiburg.de/~may/lopix>.
